

FIZIX KORNER

by

Peter A. Lindemann

There was such strong interest in my article on the oranur emergency in Hawaii in 1978, that I thought it would be worth while to expand on the subject further. Oranur is a pollutant in the environment that very few people know about. Even fewer understand its unique danger. With that in mind, I will relate a few more of my experiences. (Also see the bulletin board in this issue for clarification on the difference between oranur and DOR.)

(For those who are reading this article first, it is a follow-up to the Fizix Korner article in the July-August 1992 issue of this Journal.)

For the purposes of clarity, I would like to start this article by elaborating on the nature of oranur again. Oranur is so unlike any other bio-energetic condition that almost everyone I have spoken to about it cannot describe it back to me in their own words. The concept is simply too foreign. First of all, oranur is orgone energy in a particularly disrupted state. It consists 100% of life force. Wherever oranur exists, it is part of the orgone energy continuum. Oranur is orgone energy that has been acted upon and taken on some of the characteristics of nuclear decaying material. So called radioactive material can be described as matter that has lost its integrity. In other words, it is dis-integrating. If you think of each element as having an identity, such as carbon or uranium, then the radioactive elements are the ones that are losing their identity. They are in the process of becoming something other than what they are now. Since orgone energy is so fundamental and primal, it cannot become something else. But it can take on the characteristic of dis-integration, which is the antithesis of its essential nature.

Normally, orgone energy is the self-organizing, integrating, animating force in nature. When acted upon by nuclear decaying material, it loses its self-organizing and integrating characteristics, but remains the animating force in nature. The presence of oranur impedes the self-organizing (healing) activities of living organisms and promotes their disintegration (death). Oranur is living energy whose essential nature has been so disrupted, that it can no longer function as part of the whole of Life, and now behaves as though it is a mortal enemy. The self-organizing and

integrating character of the life force I have described as its patternability. Oranur is life force that has lost its patternability; its ability to be patterned.

Here is another way of looking at the subject. In simplistic terms, if we think of orgone energy as "good", then DOR can be thought of as "bad." This good-bad dichotomy describes the boundaries of a system of moral values. Oranur then would be a purely amoral act, completely oblivious to the previously established good-bad system of values. It is neither "good" (moral) nor "bad" (immoral), but its effect is to the detriment of "good." I hope this further elaboration helps the reader understand the nature of oranur a little better. Now, on with the story.

The oranur that passed through Hawaii in late October of 1977 originated from an atmospheric nuclear test, somewhere in the South Pacific. All of my orgone accumulators became unusable after that. However, the worst emergency involving an orgone accumulator occurred on the island of Maui in the little town of Kula. Earlier, in the summer of 1977, a friend of mine named Paul, who lived in Kula, had been in an accident. He phoned and asked me for directions on how to build an orgone accumulator, as he had seen my units on an earlier visit. I gave him the instructions, and he subsequently built a 4-layer accumulator and used it successfully to accelerate his recovery. (This gentleman is a recording artist and concert pianist of some renown, so I will refrain from using his full name.) After his recovery, the speed of which amazed his doctors, Paul left Maui on an extended concert tour and rented his house out to some friends.

As it turned out, Paul had left his orgone accumulator set up in a closet and when the oranur came through, it became badly poisoned. The person who rented that room was a student of a locally famous healer on Maui at the time named David Little. David was a gifted healer who had studied nutrition, homeopathy, dowsing, radionics and much more. (This person's real name has slipped my mind, so I will call him Sean.) Sean had studied with David Little for over a year and was in excellent health when he moved into Paul's house. He never used the accumulator, but did sleep within 10 feet of it. When Sean's health took

a severe nose-dive in January of 1978, he and David thought it might have something to do with the accumulator. Sean called me on the Big Island after he found out that I had given Paul the directions on how to build it. He told me what the situation was and I told him what I thought he should do. After I hung up the phone, I realized that the situation might be more serious than they could appreciate, so I wrote out 6 pages of detailed instructions on how to handle what I considered an emergency. Keep in mind that when the oranur poisoned my accumulators in late October, I dismantled them within a few weeks. This accumulator on Maui was left assembled until January and was in a much more dangerous condition by then.

Sean showed David my letter when it arrived. David was skeptical of the need for the extreme precautions that my letter recommended. Being an accomplished dowser, David decided on a simpler, more direct approach; he would just dowse out the problem and its solution himself. He and Sean went up into his room, opened the accumulator and stepped inside. David got out his pendulum and started asking questions. No matter what David asked, the pendulum would only swing in a counter-clockwise direction. After 5 minutes of this, both David and Sean became frightened. The pendulum was totally unresponsive, and neither of them had ever encountered this before. They dropped back and decided to look at my letter again.

My first recommendation was to find the perimeter of the affected area. I had suggested that it may be some distance from the accumulator. They eventually found the perimeter of the oranur field being supported by this orgone accumulator over 120 yards away! At this point, in shock and terror, they set up a base of operations to clean up the problem from over a block and a half away from the house. By this time, they knew they were in way over their heads, so they decided to follow my instructions.

It must be difficult for the average reader to comprehend, but the area affected by severe DOR and oranur from this accumulator was $\frac{1}{8}$ th of a mile in diameter. To compound the problem, it was located in a residential area. Many innocent people were exposed to a deadly influence for months during this incident.

The first thing to do was to bring down the high levels of oranur charge in the accumulator while limiting personal exposure to this deadly energy. Since orgone energy is readily absorbed by water, the procedure they used was as follows. (Keep in mind, that we did not know about the Copen Radiation Rectifier at

this time.) One person at a time was to run into the accumulator with a bucket of water and a sponge, rinse down one inside wall of the accumulator with water while wearing rubber gloves, run back out and take a 15 minute shower. This procedure was repeated for each inside wall, floor and ceiling. After this was done, over 90% of the noxious energy was in the 6 buckets of water. Compressed air from a scuba tank was bubbled through the water until the DOR was cleared and then the water was poured onto some healthy plants. After this, the accumulator was rapidly disassembled. The organic materials and the frame were burned. The sheet metal was cut up into six inch squares and buried two feet underground in the woods with markings on the container indicating extreme danger from radioactive materials. After the accumulator was gone, they set out to clear themselves of the noxious energies. David found that a great deal of the DOR and oranur had lodged in the testicles and in the blood. Homeopathic radiation remedies, yogic breathing exercises and repeated masturbation cleared these energy residues out of their bodies. Homeopathic radiation remedies were radionically broadcast to the whole area until the neighborhood was clear.

Within a short period, Sean's odd blood decomposing condition cleared up and by March of 1978, the oranur emergency on Maui was over. Paul was a bit nonplused at the destruction of his accumulator in his absence. To this day, I'm not sure he understood why it was necessary. Sean was rapidly developing leukemia and would have died within 6 months (I surmise) if nothing had been done. Today, a SpaceCrafter or Copen Radiation Rectifier could clear the whole mess out in a few hours, but without these tools, the situation was very dangerous.

Another, smaller incident happened about six months later a half mile from where I lived. A friend of my girlfriend had begun noticing that she felt very uneasy going near her microwave oven. It had gotten to the point that she no longer liked to use it. Her reaction was purely emotional; she simply dreaded going near it and she did not know why. When I heard about this, I told her that I understood what her problem was and reassured her that she was not crazy. At the same time, her husband didn't notice anything different or unusual around the oven.

The next day I went down to her house with my Copen Radiation Rectifier. Sure enough, her microwave oven was poisoned with oranur. I determined this by a few simple tests. First, I tried to put my head inside the oven after I made sure it was unplugged. I was

confronted with an immediate pressure headache. I pulled my head out and the headache instantly went away. Next, I put my hand inside the oven and within 5 seconds, an odd tingling feeling was evident. When I pulled my hand out, however, this weird tingling feeling came with it and clung to my hand. The oranur felt stuck to my hand like a gluey energy residue. Washing my hands under running water did not completely remove this eerie feeling. I put the Radiation Rectifier in the oven and ran it for about 30 minutes. When it was done, all the oranur was cleared. Putting my head or hand inside the oven this time produced no unusual sensations at all. A month later I went back and re-tested the oven and it was still clear of oranur. The oranur that had been cleared from this microwave oven had not been produced by its normal operation. It must have picked up the oranur from an external source. (Probably the same source that poisoned my accumulators.)

I have also encountered low grade oranur conditions that had built up to dangerous levels in other ordinary household appliances. One filing cabinet, for instance, was sufficiently poisoned with oranur to produce non-specific anxiety and splitting headaches for its bewildered owner. All of these symptoms vanished and never returned after using the Radiation Rectifier. This filing cabinet had become poisoned with oranur when a radioactive smoke detector had been left sitting on it for a few days before it was installed.

It is important to understand that any metal enclosure can, under the right circumstances, behave like an orgone accumulator. Filing cabinets, ovens, microwave ovens, metal cookie jars and other metal enclosures can and do quite often accumulate orgone energy at densities above the atmospheric norm. This is fertile ground for noxious energies to gather, stagnate and fester. Periodic exposure to these energy fields is a severe stress on a person's health that eventually appears as the breakdown of the weakest system. In situations such as this, each person's symptoms are different and there appears to be no common connection. The common cause of oranur exposure is never suspected. Also, the presence of oranur masks other symptoms and is undetectable by radiesthetic, radionic, or any other medical means. Only periodic use of devices like the Copen Radiation Rectifier or the SpaceCrafter can keep an area clear of the problems presented by oranur.

I hope these horror stories serve as a wake up call to our readership. We live in a world that has experienced hundreds of atomic bomb explosions. These nuclear detonations have laced the environment with billions of grams

of radioactive elements. On top of that, millions of radioactive smoke detectors have been installed in buildings that we frequent. Exposure to low levels of oranur is, for most of us, almost a daily occurrence.

Here are a few things you can do to limit your exposure to oranur. First, if you own any smoke detectors, see if they contain radioactive materials. If they do, it is listed on a label on the bottom. Usually, these smoke detectors are of the "ionization" type and contain .8 to 1.0 microcuries of Americium, element 95. If you own one of these, get rid of it (safely) and replace it with a smoke detector that operates on the "photo-electric" method. FirstAlert makes both types, so make sure you are buying the right replacement. Second, consider buying an appliance that clears oranur, like the Copen Radiation Rectifier or the SpaceCrafter. Third, you can lobby your government officials to stop the nuclear (bomb) testing program and shut down all nuclear research facilities. Fourth, do not buy or eat irradiated foods as they contain a significant residue of oranur. Last, never travel within 10 miles of an operating nuclear power station and definitely don't take the guided tour. (And if you are inclined, work to get them all shut down. Also, avoid being stationed on or visiting nuclear powered submarines, aircraft carriers, weapons depots, etc. etc. etc....)

In closing, I would just like to thank everyone who responded to the first article about oranur. Many of you are building the Copen Radiation Rectifier, have bought a SpaceCrafter, or are using the clearing procedure for the SE-5. For humanity to survive the global oranur emergency, we will need an army of people with this technology constantly clearing their own locality. Thank you for volunteering for this sacred service to the Life Force. A special thanks goes to Lutie Larsen for printing the complete oranur clearing procedure for the SE-5 in her Sept/Oct newsletter to SE-5 users. Thanks for getting the word out!

Well, 1992 has been an amazing year for high quality information. I expect 1993 to be even better. Until then, have a happy holiday season and in spite of all the spiraling madness in this world, be mindful of all we have to be thankful for.

Practice...and you may succeed in unbelievably a lot of unnecessarily unbelievable stuff. After that, you will have a place to put some real knowledge about real facts.

Richard S. Shaver
